Introduction

Part I - THE FOUNDATIONALIST APPROACH

1. **Outline of the foundationalist approach**
 1. Features of the foundationalist approach - 2. Philosophy and justification - 3. The domain of philosophy
2. **Origins of the foundationalist approach**
 1. Impossibility of a logic of discovery - 2. The role of genius - 3. The nature of method - 4. The concrete view - 5. Conditions on axiom systems - 6. Philosophy as a logic of justification - 7. Method of the logic of justification
3. **The foundationalist approach and certainty**
 1. A priori knowledge - 2. Pure intuition - 3. Construction - 4. Axiomatic method and construction
4. **Impact of the foundationalist approach**
 1. Centrality of intuition - 2. The nature of the method - 3. The abstract view - 4. Conditions on axiom systems - 5. Metamathematics as a logic of justification
5. **Mathematics in romantic cloths**
 1. A widespread opinion - 2. An alleged implicit philosophy - 3. Romanticism and mathematics - 4. The impact of romanticism - 5. Romanticism and the abstract view - 6. «Nescimus sed sciemus»
6. **The consistency and conservation programs**
 1. Paradoxes - 2. Finitary and infinitary mathematics - 3. The consistency program - 4. The conservation program - 5. Equivalence of the two programs - 6. Expectations as to the feasibility of programs
7. **Mathematics as a closed system**
 1. The closed world assumption - 2. Stating the closed world

assumption - 3. Basis of the certainty of axioms - 4. The articulation of the closed world assumption - 5. The nature of mathematics

Part II - LIMITATIONS OF THE FOUNDATIONALIST APPROACH

8. The limitative results
 1. Incompleteness and undecidability - 2. Undefinability of truth - 3. Unprovability of consistency - 4. Unprovability of external consistency - 5. Non-characterizability - 6. Existence of false extensions - 7. Incompleteness w.r.t. logical validity
9. Resistance to the fall
 1. Formalizability of existing mathematics - 2. Formalizability in a sequence of formal systems - 3. Non-formalizability of finitary mathematics - 4. Using systems with consistency constraints - 5. Justifiability of the hard core of mathematical practice
10. The illusion of intellectual intuition
 1. Mathematics and the spirit of time - 2. Intellectual intuition - 3. The phenomenological method - 4. Inadequacy of the phenomenological method
11. Failure of the foundationalist approach
 1. Untenability of the closed world assumption - 2. Advantages of incompleteness over logical validity - 3. Mathematical thought and formal systems - 4. Untenability of the foundationalist approach
12. Intuition and monsters
 1. Monsters - 2. Curves and tangents - 3. Curves and squares - 4. Curves and length - 5. States and boundaries - 6. Surfaces and areas - 7. Decomposition of spheres - 8. Intuition and certainty
13. Correctness of proofs
 1. Errors in proofs - 2. Checking the formalization - 3. Long proofs - 4. Computer-aided proofs
14. Defects of reductionism
 1. Axiomatic reductionism - 2. Axiomatic anti-reductionism
15. Limits of the abstract view
 1. Defects of the abstract view - 2. Inconsistencies of supporters of the abstract view

16. The axiomatic method in humble cloths
 1. Organization logic - 2. Unification logic - 3. Postulation logic - 4. Logic of discovery - 5. Weak justification logic - 6. Inversion logic
17. The foundationalist approach and mathematical objects
 1. The problem of mathematical existence - 2. Role of the problem of mathematical existence - 3. Fall of the problem of mathematical existence - 4. Irrelevance of the problem of mathematical existence

Parte III - THE HEURISTIC APPROACH

18. Outline of the heuristic approach
 1. Features of the heuristic approach - 2. The role of discovery in mathematical activity - 3. Nature of the methods of discovery
19. The origins of the heuristic approach
 1. Necessity of the method - 2. Method as logic - 3. The nature of the method
20. The heuristic approach and certainty
 1. Logic of discovery and certainty - 2. Intuition and deduction - 3. Impossibility of intuition and deduction rules - 4. Abandoning the logic of discovery
21. The ampliativity of inference
 1. Abandoning the myth of certainty - 2. The inference paradox - 3. Non-ampliativity of sound inference - 4. Objections against non-ampliativity - 5. Need for extending the domain of logic
22. The analytic method
 1. Infinity of the hypothesis search - 2. The reduction method - 3. The method of hypotheses - 4. Analytic vs. axiomatic method - 5. Fortune of the analytic method
23. Opposition to the analytic method
 1. Unfoundedness of hypotheses - 2. Algorithmic character of hypotheses - 3. Need for intuition and divination - 4. Infinite regress - 5. Infinite path - 6. Uniqueness of hypotheses - 7. Locality - 8. Modularity
24. Advantages of the analytic method
 1. Explaining problem solving - 2. Producing new information - 3.

Interacting with existing knowledge - 4. Changing the rules during problem solving - 5. Incompleteness - 6. Justification of hypotheses - 7. Correctness degrees of proofs - 8. Plurality of proofs - 9. Analytic anti-reductionism

25. *Reductio ad absurdum* and the analytic method
 1. *Reductio ad absurdum* - 2. Differences w.r.t. the analytic method - 3. Indirect proof - 4. *Modus tollens* - 5. *Reductio ad absurdum* and immediate experience
26. Mathematics as an open system
 1. The open world assumption - 2. Interactive character of the development of mathematics - 3. Need for the open world assumption - 4. The articulation of the open world assumption - 5. The nature of mathematics - 6. Problem solving vs. theorem proving - 7. Fallibility vs. infallibility
27. Mathematics as problem solving
 1. The main questions of the heuristic view - 2. Raising mathematical problems - 3. Positing mathematical problems - 4. Solving mathematical problems - 5. Plausibility of mathematics as problem solving

Part IV - DISCOVERY PROCEDURES

28. Triviality of abduction
 1. Non-deductive inferences to find hypotheses - 2. Abduction and hypotheses - 3. Abduction and creativity - 4. Abduction and *apagogé* - 5. Abduction and *inventio medii*
29. The reasons of the Epicurean logic
 1. The centrality of deduction - 2. Need for induction and analogy
30. Induction
 1. The role of induction - 2. Objections against induction - 3. Prejudices against induction - 4. Induction and certainty - 5. Induction from several cases - 6. Induction from a single case - 7. Induction and probability
31. Analogy
 1. The role of analogy - 2. Analogy by quasi-equality - 3. Analogy by separate indistinguishability - 4. Analogy by equiproportionality - 5. Analogy by concordance - 6. Analogy by concordance and discordance

32. Induction and analogy
 1. An elusive relation - 2. Induction as a subspecies of analogy - 3. Analogy as a subspecies of induction - 4. The relation between induction and analogy
33. Diagrams
 1. Diagrams and mathematical thought - 2. Diagrams and induction - 3. Diagrams and analogy - 4. Diagrams and vision - 5. Diagrams and intuition - 6. Diagrams and errors
34. Generalization and specialization
 1. Generalization - 2. Specialization - 3. Union of generalization and specialization
35. Metaphor and metonymy
 1. Metaphor - 2. Extra-mathematical metaphors - 3. Intra-mathematical metaphors - 4. Metonymy
36. Definition
 1. Definition as abbreviation - 2. Limits of definition as abbreviation - 3. Definition as a discovery tool - 4. Heuristic differences between definitions
37. Hybridization
 1. Hybrids - 2. Hybrids and geometry - 3. Hybrids and infinitesimal calculus
38. Data variation
 1. Total data variation - 2. Partial data variation
39. Completion of the method
 1. Non-deductive inferences as an open system - 2. Explanations and additions concerning non-deductive inferences - 3. Completion of the analytic method
40. The heuristic view and mathematical objects
 1. Mathematical objects as hypotheses - 2. Characters of mathematical objects as hypotheses - 3. Fictionalism - 4. Hypotheses vs. fictions - 5. The limits of fictionalism

Part V - MATHEMATICS AND THE PHYSICAL WORLD

41. Mathematical objects and the physical world

1. Relation between mathematics and the physical world - 2. Abstraction - 3. Idealization - 4. Ideal agents - 5. Mathematical objects as hypotheses

42. Parallelism and the applicability of mathematics

1. Parallelism - 2. Limitations of parallelism - 3. Applicability of mathematics - 4. Mathematical laws and the physical world

43. The effectiveness of mathematics

1. Geometrical and mechanical curves - 2. Vibrating strings - 3. The notion of function - 4. Analytic functions - 5. Renormalization - 6. Deterministic chaos - 7. The reasonable ineffectiveness of mathematics

44. The naturalization of mathematics

1. Mathematics and survival - 2. Hypotheses and adaptation - 3. Geometry and adaptation - 4. Arithmetic and adaptation - 5. Problem solving and adaptation

Conclusion
